No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                 Score

                                                                                                                                                                                                                                                                                                                 /note-"vector: BlueScript SK; Site_1: Eco RI; Site_2: XhoI; The library is from early (spring) wood, taken from three six-year old trees (three different genotypes), in the juvenile phase. These trees were induced to form compression wood by bending to a 45 degree angle and tying them to the ground. Differentiating xylem was harvested from the bottoms of the inclined stems, and a mixture of all three genotypes was used for the library. oligo-dT primed cDNA was directionally cloned into the EcoRI-XhoI BlueScript SK vector arms. NOTE: The sequences contain a 'CDNA adapter' between the EcoRI site and the start of the EST. The adapter sequence is 'AATTCGGCACGAG'."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             two fold molar excess of a NotI/HindIII digested plasmid DNA (lafmid BA vector, a phagemid derived from pEMBL, Adams, M. D. et al. Nature Genet. 4, 373-389, 1993)) and electroporated into E. coll strain DH10B (BRL). The library was amplified and further selected for clones containing long inserts (>500 bp) by purification of the plasmid DNA from a fragment of a 1% low-melting-point agarose gel, containing the smear of the library and electroporation into DH10B cells. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (isoniazid), mabA (isoniazid), rpsi,512 (streptomycin), 165/rrs (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23 (astithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and characterization of M. tuberculosis present in a sputum sample. The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsi/s12 and 233 genes for the presence of antiblotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the presence of antiblotic resistance inducing mutations. Genotypic tests are rapid, sensitive and accurate providing information as to

The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/sl2 and 23S genes for the presence of antibiotic inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the

The present sequence is that of the Mycobacterium tuberculosis rpoB (rifampin resistance) gene (bp2161-2640). Amplification cycle sequencing primers (see AAA49823-62) are used for the de and analysis of antibiotic resistance-associated mutations in defined regions of rpoB (rifampin), katG (isoniazid), oxyR-aph (isoniazid), mabA (isoniazid), rpsL/s12 (streptomycin), 16S/rr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR amplification was used to obtain rpoB genes from rifampicin-resistant Mycobacterium leprae strains. A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) revealed mutations in the region encoding amino acids 400-450. The corresp. region was isolated from M.tuberculosis (AAQ61457). A common mutation seen in resistant strains occurs at codon 425 where Ser is substituted, most frequently by Leu.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rapid detection of ant isoniazid, rifampicin by detecting mutation
                                                                                                                                                                                     Disclosure;
                                                                                                                                                                                                                                 Method for the detection and characterization of \mbox{\sc Mycobacterium} tuberculosis with antiblotic resistance in a sample -
                                                                                                                                                                                                                                                                                                                                                                Shipman

The method involves performing a sequencing procedure, with or without prior amplification, to detect the presence of M. tuberculosis, and if present to evaluate the rpoB, katG, rpsL/s1: and 23S genes for the presence of antibiotic-inducing mutations. If M. tuberculosis is detected, a second sequencing procedure is performed on the sample to evaluate additional genes for the
                           Cleavage of nucleic acids using an enzyme, especially a nuclea selected from the group consisting of Cleavase (RTM) BN enzyme Thermus aquaticus DNA polymerase, Thermus thermophilus DNA polymerase, Escherichia coli ExoIII and the Saccharomyces cere Rad1/Rad10 complex. The nucleic acid substrate is preferably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   rpoB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (streptomycin), embB (ethambutol), pncA (pyrazinamide), gyrA (ciprofloxacin) and 23S (azithromycin) genes of M. tuberculosis. These primers can be used in a method for the detection and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and similar immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bg region of the Mycobacterium tuberculosis rpb gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified mutatic are given in AAT29124 (Wild type) and AAT29125-26

The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 bg region of the Mycobacterium tuberculosis robs gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified mutater region in AAT29124 (Wild type) and AAT29125-26 mutations are given in AAT29124 (Wild type) and AAT29125-26

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially hepatitis C virus (HCV) and simian immunodeficiency virus (SIV). Two primers (AAT29122, AAT29123) were used to amplify a 620 b region of the Mycobacterium tuberculosis ryoB gene, which, when mutated is associated with rifampin resistance. The 620 bp region amplified spans both the H451Y and S456L mutations. The amplified fragments are given in AAT29124 (Wild type) and AAT29125-26

This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. tuberculosis and the concurrent determination of its drug
                          susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.

Polynucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241, Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of an organism

The present invention describes a method for generating a repertory of CC nucleic acids of tuf, fus, atpD and/or recA genes from which probes CC and/or primers are derived: The method comprises amplifying the nucleic CC acids of determined algal, archaeal, bacterial, fungal and parasitical CC species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more CC related microorganisms e.g. algae, archaea, bacteria, fungi and CC parasites, for universal detection and for specific and ubiquitous CC detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) CC obtained using the method of the invention can be used for the universal CC detection of any bacterium, fungus or parasite in a sample and for the CC detection of at least one antimicrobial agent resistance gene or at CC least one toxin gene. hexa nucleic acids are used for the specific and CC ubiquitous detection and for identification of Streptococcus pneumoniae. CC (I) can be used to design a therapeutic agent which is effective against CC microorganisms. Microbial species or genus or family or phylum or group CC which can be detected include Abiotrophia adiacens, Bordetella sp., CC wynebacteriaceae family, Pseudomonads group, Escherichia coli, CC Mycobacteriaceae family pseudomonads group, Escherichia coli, CC Mycobacteriaceae family pseudomonads group, Escherichia coli, CC Mycobacteriaceae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the rpoB gene from Mycobacterium tuberculosis. Rifampin resistance is largely associated with point mutations localised in a small core region of 81 base pairs in the rpoB gene, which encodes the RNA polymerase beta subunit. To detect a mutation, a complex is formed comprising a first sequence representing the predetermined region of the gene of the organism and a second sequence representing the corresponding region of the gene of the wild type organism in double stranded form. Each member of at least one pair of non-complementary strands within the complex has a label. The association of the labels in the complex is related to the presence of the mutation. The presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2122

The method comprises detecting the presence of a least 1 mutation in a first sequence and relating the presence of the mutation to drug resistance. Included in the invention are a kit for carrying out the method and a method for detecting the presence of a difference between two related nucleic acid sequences in an organism. I methods are useful for detecting resistance to drugs such rifampin and pyrazinamide in Mycobacterium. The present sequence represents the Mycobacterium tuberculosis rpoB gene (which encodes the RNA polymerase beta subunit). The sequence is used in an example of the method of the invention for the detection of rifampin resistance in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting resistance of drugs such as rifampicin Mycobacterium, comprising detecting mutations in them to drug resistance -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The antibiotic resistance spectrum (ARS) of a mycobacterium can be determined by amplifying the relevant part of the antibiotic resistance gene, i.e. the M. tuberculosis rpoB gene fragment amplified using the primer set AAT12091-98, hybridising it with a least 1 rpoB gene probe, detecting the hybrids formed and inferring the ARS, and opt. the spp., from the differential hybridisation patterns. The method spartic. useful for the detection of rifampicin and/or rifabutin resistance in M. leprae or M. tuberculosis, and mycobacterial spp. identification. The method is rapid and reliable and provides simultaneous determn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       M.leprae

A comparison with the sequence of the rpoB gene from sensitive strains (AAQ51532) revea mutations in the region encoding amino acids 400-450. A common mutation seen in resistant strains occurs at codon 425 where Ser substituted, most frequently by Leu.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the GC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coil, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets of or antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in CC essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part CC format directly from WIPO at CC format directly from WIP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 84.0
